Intermediate Microeconomic Theory ECN 100B (Section A), Fall 2019

Professor Brendan Price

Final Exam

Name: .			
ID num	ber:		

- Write your answers on the exam itself, using only the space provided for each question.
 - If you run out of space for a question, write "see extra space" in the space provided for that question, then finish your answer in the extra graded space at the end of the exam. Be sure to write the question #. You may lose credit if we can't tell which question you're answering.
 - We've also included <u>ungraded</u> scrap space for pure scrap work. Answers written in this ungraded space will not be graded under any circumstances.
- Show your work on every question that requires a calculation. We will award partial credit as appropriate. Correct results without adequate work will receive little or no credit.
- Simplify all mathematical expressions as much as possible.
- There are six pages with questions (pages numbered 2, 3, 4, 5, 6, 7). After the exam starts, make sure that you have all of the pages and that your exam booklet is stapled properly. If there is a problem with your exam, we will give you a new copy.
- ullet The exam is graded out of 60 points. Each question is worth the indicated number of points.
- You will have 120 minutes. You must drop your pen/pencil immediately when time is up. If you keep writing after time is called, we will deduct points.
- As a reminder: UC Davis has a strict code of Academic Conduct. Any violations, including copying or attempting to copy from another student, will result in a score of 0.
- Good luck!

Do not turn this page until I tell you to start.

1. Up in the Air (4 pt.)

Demand for Uber rides to the airport is p(Q) = 20 - Q. Suppose Uber is a uniform-pricing monopolist.

a. (2 pt.) Suppose Uber's costs are $C(Q) = 4Q + Q^2$. Write Uber's profits as a function of Q. Then find Uber's profit-maximizing choice Q_m .

b. (2 pt.) Now suppose Uber's costs are C(Q) = 24Q. Find Uber's profit-maximizing choice Q_m . What is the socially optimal quantity, Q_s ?

2. Wall Street (6 pt.)

Australis and Borealis are equally promising companies: each share of either Australis or Borealis stock is worth \$6 with probability $\frac{1}{2}$ and \$0 with probability $\frac{1}{2}$. The stock prices are uncorrelated.

a. (2 pt.) Find the expected value and variance of a portfolio consisting of two shares of Australis.

b. (3 pt.) Find the expected value and variance of a portfolio consisting of one share of Australis and one share of Borealis. If she can buy both portfolios at the same price, which portfolio—the first one (from part a) or the second one (part b)—would a risk-averse investor prefer to own?

c. (1 pt.) Suppose you own 50 shares of Australis and 50 shares of Borealis. If you are risk-averse, would you prefer that the price of Australis stock be *perfectly positively correlated* with the price of Borealis stock, *perfectly negatively correlated*, or *uncorrelated*? (No need to explain.)

3. Quidditch (4 pt. total)

This year's Quidditch final is Ravenclaw vs. Hufflepuff (brought to you by Nimbus Broomsticks).

		Keeper						
		Block	Scoot	Blink				
	Lob	5, 2	8, 0	9, 1				
Chaser	Slam	2, -7	8, 1	3, 0				
	Slip	0, 6	-3, 5	1, 1				
	Slip	0, 6	-3, 5	1, 1				

- a. (2 pt.) Suppose this is a static game. Circle all payoffs corresponding to a player's best response, then list all pure strategy Nash equilibria (or write "none" if there aren't any). Be sure to write the *strategies*, not payoffs.
- b. (1 pt.) Again treating this as a static game, identify all strictly dominated strategies (or write "none" if none).
- c. (1 pt.) Now Chaser moves first. In the subgame-perfect Nash equilibrium, which action does Chaser choose?

4. Attitude problems (6 pt.)

For each situation, indicate whether the agent wants to buy the good being described by choosing one of these four options: "definitely buys", "definitely doesn't buy", "indifferent", or "not enough information". (Each option may be used once, more than once, or not at all.) If the question refers to a utility function u(w), assume that w > 0. You don't have to show your work here.

- a. (1 pt.) A shot of espresso costs \$3. My reservation price is \$2.
- b. (1 pt.) Someone with utility function $u(w) = w^2$ is deciding whether to buy a lottery ticket. The transaction is a fair bet.
- c. (1 pt.) A risk-averse agent is offered pet insurance at a price above the actuarially fair price.
- d. (1 pt.) Someone with utility function u(w) = 10w + 3 is deciding whether to buy car insurance. The insurance premium is \$30, and the expected claim is \$30.
- e. (1 pt.) Someone with utility function $u(w) = 5\sqrt{w}$ is deciding whether to buy a lottery ticket. The ticket costs \$10. Its expected value is \$8, and it has positive variance.
- f. (1 pt.) Someone with a linear utility function is deciding whether to buy a stock portfolio. The portfolio costs \$20 to buy. Its expected value is \$25, and it has positive variance.

5.	Swipe	(4 pt.))

Tolu	starts v	with a	w =	400 in	total	wealth	, consi	sting	of \$1	.00 c	ash :	plus a	a \$300	laptop,	but	there	is a
10%	chance	that	her	laptop	gets s	stolen (leaving	her	with .	just	w =	100)	. Her	utility is	u(w))=	\overline{w} .

a. (2 pt.) Compute Tolu's expected utility given this risk. Then compute her certainty equivalent.

b. (2 pt.) A startup called Swipe provides full insurance against the risk of laptop theft. What is the actuarially fair insurance premium? How much would Tolu be willing to pay for full insurance?

6. On the Road Again (6 pt.)

Freewheeler Bicycle Center offers (excellent!) bike repairs using labor as its only input, with production function $q(L) = A\sqrt{L}$, where A is a constant. It's a price-taker (p = 5) and a wage-taker (w = 10).

a. (2 pt.) Suppose that A = 12. Compute the marginal <u>physical</u> product of labor (MPPL) as a function of L. Compute the marginal revenue product of labor (MRPL) as a function of L.

b. (2 pt.) Keep assuming A = 12. Write profit as a function of L, then find the optimal choice L^* .

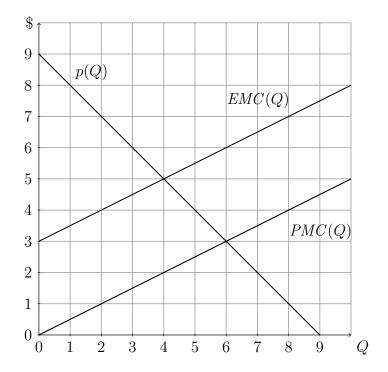

In class, we assumed firms can freely adjust L in response to "short-run" changes in market conditions. In practice, hiring new workers takes time, and labor (like capital) may be fixed in the short run.

Suppose that Freewheeler's workers learn new repair techniques, causing A to increase above 12. (Assume that p and w are unaffected by this change. Freewheeler still does not use capital.)

- c. (1 pt.) In the short run, suppose L stays at the value L^* you found in part b. Relative to their values when A = 12, the MPPL will ______ and the MRPL will ______. (rise/fall/not change)
- d. (1 pt.) In the long run, Freewheeler will adjust its choice of L to a new optimum. Relative to their values when A=12, the MPPL will $\underline{\hspace{1cm}}_{\text{(rise/fall/not change)}}$ and the MRPL will $\underline{\hspace{1cm}}_{\text{(rise/fall/not change)}}$.

7. Negative externalities (10 pt.)

Answer each question using the graph below. (You do not need to show your work here.) p(Q): demand. PMC(Q): private marginal cost. EMC(Q): external marginal cost.

Hint: the cost functions plotted above are $PMC(Q) = \frac{1}{2}Q$ and $EMC(Q) = \frac{1}{2}Q + 3$.

- a. (3 pt.) In the competitive equilibrium,
 - the quantity sold (Q_c) equals _____.
 - ullet the price equals _____.
 - the producer surplus equals _____.
- b. (2 pt.) Under perfect price discrimination,
 - the quantity sold (Q_{ppd}) equals _____.
 - \bullet the profit is _____.
- c. (3 pt.) At the social optimum,
 - the quantity (Q_s) equals _____.
 - the social marginal cost equals _____.
 - the deadweight loss equals _____.

8.	Broken	\mathbf{robots}	(5	pt.)

You run a factory with production function q(L, K) = 5L + 4K, where L is humans and K is robots. Throughout this problem, your job is to produce q = 40 units of output at the lowest possible cost.

a. (2 pt.) Let w = 4 and r = 3. How much would it cost to produce q = 40 using (only) humans? How much would it cost to use (only) robots? Find the cheapest combination of L^* and K^* .

b. (2 pt.) New technologies often break. Suppose w=4 as before, but now r is a random variable: after you choose L and K, there's a 10% chance that any robots you rented require expensive repairs, so that r=6. (Otherwise, the robots work fine and r=3.) Calculate the expected cost of using robots. If your goal is to minimize the expected cost, will you use humans or robots?

c. (1 pt.) Now suppose that—before you choose L and K—you can pay a mechanic to determine whether the robots will break. What is the most you'd be willing to pay the mechanic for this information (i.e., to learn the true value of r)? (Note: the answer is not an integer.)

9. True or false (5 pt. total)

Indicate whether each of the following statements is true or false. (You don't have to explain why.)

- a. (1 pt.) In a perfectly competitive market, the price markup equals 0%.
- b. (1 pt.) If a firm is a price-taker, then it faces downward-sloping demand (p'(Q) < 0).
- c. (1 pt.) Engaging in group price discrimination requires more information than engaging in perfect price discrimination does.
- d. (1 pt.) If a uniform-pricing monopolist is facing inelastic demand, then increasing its price will increase its profits. _____
- e. (1 pt.) In a Leontief production function, labor and capital are perfect substitutes.

10. Time to Move On (10 pt.)

Abdul and Blake are about to graduate, but first they have to clean their apartment. (The messier they leave it, the louder the voicemail they get from their landlord, and the guiltier they feel.) Let

$$Q = q_A + q_B$$

denote total time spent cleaning, where q_A and q_B are time spent by Abdul and Blake, respectively. Each roommate receives private marginal benefits given by

$$p_A(Q) = 10 - Q$$
 and $p_B(Q) = 6 - Q$

- a. (1 pt.) If the building's laundry room is free to use and doesn't have enough washing machines, we might call it a "common good". A common good is _____ and ____.
- b. (2 pt.) Express the social marginal benefit in terms of Q. (Remember: it may have two parts.)

c. (2 pt.) Suppose the marginal cost is 20 for both people. Find the socially optimal quantity (Q^{soc}) . Assuming this is a static game, find Abdul and Blake's Nash quantities (q_A^{Nash}) ?

d. (3 pt.) Now suppose the marginal cost is 8 for both people. Find the socially optimal quantity (Q^{soc}) . Assuming this is still a static game, find the Nash quantities (q_A^{Nash}) and q_B^{Nash} .

e. (2 pt.) Suppose Abdul's marginal cost is still constant at $MC_A = 8$, but Blake's is $MC_B(q_B) = q_B$. Furthermore, suppose Abdul moves first (he's leaving town early). Find Blake's best-response function, $q_B^* = BR_B(q_A)$. Then find the subgame-perfect Nash quantities q_A^{SPNE} and q_B^{SPNE} .

EXTRA GRADED SPACE: DO NOT TEAR OFF

If you need to use this extra space:

- On the exam itself, write "see extra space" next to the relevant question(s).
- On this page, clearly indicate which question(s) you are answering.

Do not tear off this page. You must return all extra space when you turn in your exam.

EXTRA GRADED SPACE: DO NOT TEAR OFF

If you need to use this extra space:

- On the exam itself, write "see extra space" next to the relevant question(s).
- On this page, clearly indicate which question(s) you are answering.

Do not tear off this page. You must return all extra space when you turn in your exam.

UNGRADED SCRAP SPACE: DO NOT TEAR OFF

Anything written on the bottom half of this page **WILL NOT BE GRADED** under any circumstances. Do not tear off this page. You must return all scrap paper when you turn in your exam.

UNGRADED SCRAP SPACE: DO NOT TEAR OFF

Anything written on this page **WILL NOT BE GRADED** under any circumstances. Do not tear off this page. You must return all scrap paper when you turn in your exam.
